

Issuer Tokenization

Enables your cards to support digital payments from issuance and extends them to new payment ecosystems through the issuer tokenization.

evertecinc.com

Issuer Tokenization

Allows card data to be replaced with secure digital credentials (tokens), enabling payments across digital channels such as mobile wallets, e-commerce, and connected devices.

Integrated with network tokenization services, this solution allows you to authorize and manage the use of your cards in new digital ecosystems while maintaining high security standards and a seamless customer experience

Evertec's issuer processing platforms integrate natively with these services, enabling transparent and efficient adoption.

Three ecosystems where tokenization creates value

eCommerce and card-on-file

Enables payments across gateways, merchants, and digital platforms where credentials are securely stored, including experiences such as Click to Pay.

Digital wallets and devices

Enables card digitization in proprietary and industry wallets such as Google Pay, Apple Pay, and Samsung Pay, using mobile devices and wearables.

New network-enabled services

Drives tokenization-based solutions such as Click to Pay, credential-on-file services, payments with AI agents, and other simplified payment experiences.

Boost your digital payments growth

- ✓ **Reduces fraud risk** in digital transactions
- ✓ **Increases approval rates** for tokenized payments
- ✓ **Decreases chargebacks** and operational costs
- ✓ **Enables** new payment channels quickly
- ✓ **Improves customer experience** with simple and secure payments

Issuer Tokenization

Key functionalities

- ✓ Enables real-time decision-making for tokenization requests
- ✓ Integrates digital wallets and payment ecosystems
- ✓ Links secure devices to digital credentials
- ✓ Validates cardholder identity using multiple methods. Including OTP
- ✓ Manages the lifecycle of tokens and cards automatically
- ✓ Processes tokenized transactions

Innovation

- Enables new digital payment channels and experiences
- Supports payments without manual card entry
- Updates credentials dynamically

Growth and efficiency

- Improves transaction approval rates
- Reduces chargebacks
- Enables the use of new network-driven solutions

Security

- Unique tokens linked to merchants, devices, or channels
- Identity verification during provisioning
- More secure ways to pay
- Reduced risk in digital payments

A foundational building block for the future of payments

- ✓ Issuer tokenization has become the standard for enabling secure digital payments, improving the customer experience, and supporting the evolution toward new interaction models in the payments ecosystem.
- ✓ With direct integration to network services and capabilities tailored to issuer processing, Evertec supports your digital transformation strategy.
